

COUGAR™

MAXIMIZE SAFETY. MINIMIZE COST.

- Cougar meets the demands of industrial users who do not require the performance of an NFPA compliant SCBA.
- Cougar is designed for use in environments that are immediately dangerous to life or health (IDLH).
- The first stage regulator has a new, larger CGA handwheel for fast and easy cylinder replacement.
- The first stage regulator is designed with minimal moving parts and attaches to the cylinder valve, eliminating the need for a high pressure hose.
- The low-profile second stage regulator attaches to the facepiece in any orientation. The housing, cover, main valve seat, and bypass knob are all constructed with new, specially developed space-age materials, making the regulator strong enough to withstand a 30-foot drop onto solid concrete.
- The TwentyTwenty® facepiece's rims, nozzle cover, exhalation valve cover, and Air Klic™ adapter are made of the same durable material as the second stage regulator.
- Survivair's Cougar SCBA features the enhanced MightyLight® backpack.
- The backpack includes hinged hip wings for stability, a hose attachment block to ensure the stable position of the first stage regulator and CGA handwheel, and a fabric tank band with a spring-loaded catch for quick and easy cylinder changes.
- The waist strap is equipped with a belt-mounted regulator holder and front-release automotive-style metal buckle for rapid donning and doffing.
- NIOSH-certified.
